Paragraph

This shows that it is possible through virtualisation and open source software to construct a s390x miniature mainframe running zLinux on a #ocfedora or fedoraproject personal computer. One of the screenshots is of the same web administration console that would be offered with a real mainframe running zLinux.

To use, on Fedora, you will need to install `virt-manager` and its s390x features.

IBM Lighthouse

To the extent that RHEL is open source, all the software involved is open source. An intending user should licence RHEL10 from Red Hat. For IBMers, Red Hatters, and hobbyists, the price of that is zero.

This machine is not a practical proposition for IBM's paying customers (well, maybe it is for demonstrations) , but it could be useful as a marketing novelty and for introducing schoolchildren and others to IBM mainframes.

I have given the URLs of the resources which should enable this to run on a Microsoft Windows system, but I have not tried this myself. It should also be able to run on Apple MacOS but assembling the parts needed is slightly trickier; the parts needed are all open source.

Note that the 'mainframe.zip' download is about 20 Gigabytes unzipped, so may take several minutes to process.

Keywords: zLinux, RHEL, IBM mainframes, Operating system, Software

Additional Data

Key Features and Functions ? *

Minimum 25 characters

 AskLighthouse **B** *I* U *T* Paragraph      

You can run this anywhere without the expense and effort of raised floors etc.

Characters: 78

Key Benefits, Savings, and Return on Investment (ROI) from using the Asset ? *

Minimum 25 characters

 AskLighthouse **B** *I* U *T* Paragraph      

The cost of this is trivial, so any sales you gain from deploying this is likely pure profit.

IBM Lighthouse

Characters: 93

Effort, Time and Skills needed to deploy the Asset ? *

Minimum 25 characters

 AskLighthouse **B** *I* U *T_x* Paragraph     

20 minutes to download and boot your 'mainframe'. Low skill requirement.
